...

The subalpine forest is a transition zone from dense forest below to alpine tundra above treeline. Treeline is not really a line, but rather a zone where trees gradually get smaller and more stunted until conditions are too challenging for tree growth. At the upper edges, centuries old trees may sprawl along the ground bowing before the wind.

**EcoCheck: Australia's Alps are cool, but the heat is on** Alpine and subalpine calcareous grasslands occur above the timberline on base-rich soils in the high mountains of Europe. Harsh climatic conditions (i.e., low temperatures, prolonged frost, heavy snow accumulation), which limit the vegetative period to a few months, characterize this habitat.

## **Technical Report 2008 11/24**

Our results show that germination traits in high-mountain grasslands are closely linked to the alpine-subalpine gradient. Alpine species, especially those from stripped and wind-edge communities, prefer warmer germination niches, suggesting that summer emergence prevents frost damage during seedling establishment.
