If there is any connection to any other circuits then a non-trivial network has been formed and at least two ports must exist. Often, "circuit" and "network" are used interchangeably, but many analysts reserve "network" to mean an idealised model consisting of ideal components. Transfer function

The circuit elements are resistors, capacitors, inductors, voltage sources, current sources etc. Current, voltage, resistance, impedance, reactance, inductance, capacitance, frequency, electric power, electrical energy etc are the different electrical parameters we determine by network analysis. In short, we can say, an electrical network is the combination of different circuit elements and the network analysis or circuit analysis is the technique to determine the different electrical ...

In a non-linear circuit the parameters change with voltage and current. A passive network is a one which contains no source of EMF. A active network is a one which contains one or more sources of EMF. A bilateral circuit is one whose properties or characteristics are same in either direction of current. Example: the usual transmission line is bilateral.

About Electrical Circuit Theory - Bright Hub Engineering

In a network analysis of such a circuit from a topological point of view, the network nodes are the vertices of graph theory and the network branches are the edges of graph theory. Standard graph theory can be extended to deal with active components and multi-terminal devices such as integrated circuits.
