A gene is a DNA sequence that a cell uses as an instruction for the construction of other molecules. Most genes code for the construction of proteins by defining the amino acid sequence that is required to build a fully functional protein. If the DNA sequence has an error in it, this has the potential to lead to an error in the amino acid sequence of that protein.

The genetic code is the set of rules used by living cells to translate information encoded within genetic material (DNA or mRNA sequences of nucleotide triplets, or codons) into proteins. Translation is accomplished by the ribosome, which links proteinogenic amino acids in an order specified by messenger RNA (mRNA), using transfer RNA (tRNA) molecules to carry amino acids and to read the mRNA ...
